DECLARATION

I hereby declare that the project entitled **"Vitamin Vision – Detection of vitamins"** submitted by me to the School of Computer Science and Engineering, Vellore Institute of Technology, Chennai Campus, Chennai 600127 in partial fulfilment of the requirements for the award of the degree of **Bachelor of Technology – Electronics and Computer Engineering** is a record of bonafide work carried out by me**.** I further declare that the work reported in this report has not been submitted and will not be submitted, either in part or in full, for the award of any other degree or diploma of this institute or of any other institute or university.

Signature

Adarsh Singh 22BLC1372

Vellore Institute of Technology
(Deemed to be University under section 3 of UGC Act, 1956)

School of Electronics Engineering

CERTIFICATE

The project report entitled "**Vitamin Vision – Detection of vitamins**" is prepared and submitted by **Adarsh Singh (Register No: 22BLC1372)**. It has been found satisfactory in terms of scope, quality and presentation as partial fulfilment of the requirements for the award of the degree of **Bachelor of Technology – Electronics and Computer Engineering** in Vellore Institute of Technology, Chennai, India.

Examined by:

Examiner I **Examiner II**

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Dr. Annis Fathima A, Head of the Department, B.Tech Electronics and Computer Engineering, School of Electronics Engineering, VIT Chennai, for his continuous support and encouragement throughout the course of this project. His guidance has been invaluable in helping me successfully complete my work.

I am also deeply thankful to Dr. Ravi Sankar A, Dean of the School of Electronics Engineering, VIT Chennai, for providing the resources and academic environment necessary for conducting this project. His leadership has been instrumental in fostering a culture of research and innovation within the school.

My heartfelt thanks go to Dr. Reena Monica P, Associate Dean (Academics) of the School of Electronics Engineering, VIT Chennai, for her academic insights and unwavering support. Her advice has played a key role in shaping the direction of this project.

I am equally grateful to Dr. John Sahana Rani Alex, Associate Dean (Research) of the School of Computer Science & Engineering, VIT Chennai, for her encouragement and valuable feedback on my research. Her expertise has significantly contributed to the refinement of this work.

I would also like to acknowledge the invaluable contributions of my project collaborators Satyam Mishra, Kanudh Nayyar, and Dhruv Kumud. Their teamwork, dedication, and collaboration were key to the successful completion of this project.

Lastly, I extend my deepest gratitude to my parents and friends, whose support and understanding have been a constant source of motivation throughout this journey.

ABSTRACT

Vitamin Vision is a health-focused project aimed at helping individuals manage their vitamin intake using technology. With rising vitamin deficiencies, this tool uses image recognition to analyze food content, providing users with a nutrient profile of their meals. This encourages balanced vitamin intake, reducing deficiency risks. By blending health science and AI, Vitamin Vision supports informed dietary choices, making personal health management easier and contributing to better overall health.

Limitations of the Present Scenario:

Current methods for tracking nutrient intake are manual, time-consuming, and often inaccurate. Diet tracking apps primarily focus on calories rather than specific nutrients, leaving gaps in dietary management. Without professional guidance, it's challenging for individuals to meet their nutrient needs, leading to potential deficiencies. Existing tools don't offer real-time, precise tracking for vitamins, and users struggle with tedious logging and limited insights, which hampers effective dietary balance.

Problem Addressed:

Vitamin Vision addresses the lack of accessible tools for tracking vitamin intake. Many people struggle to monitor their nutrient levels due to the limitations of current dietary tracking methods, which often overlook vitamin-specific analysis. Deficiency in essential vitamins can lead to serious health issues, but tracking specific intake remains a challenge. By analyzing food for vitamin content, Vitamin Vision makes monitoring easier, helping users avoid deficiencies and maintain a balanced diet.

Proposed Solution:

Vitamin Vision offers an AI-based mobile app that uses computer vision to analyze vitamin content in food images. By photographing their meal, users receive a breakdown of vitamins, tailored to address any deficiencies. The app uses a robust dataset and machine learning to identify foods and estimate nutrient composition. Integrated with health trackers, it provides real-time vitamin data, empowering users to make healthy dietary choices and prevent deficiencies through personalized, actionable insights.

1. INTRODUCTION

Introduction

Vitamin Vision is an AI-driven initiative designed to support users in monitoring and optimizing their vitamin intake using machine learning and computer vision. As vitamin deficiencies continue to affect global health, this project addresses the challenge of tracking daily nutrient intake by analyzing the vitamin content of food items through a simple image capture. Vitamin Vision employs the powerful VGG19 Convolutional Neural Network (CNN), chosen for its deep architecture that allows for precise feature extraction, enabling accurate detection and quantification of essential vitamins from food images. The project integrates several advanced techniques, including data preprocessing methods like normalization, augmentation, and edge detection, ensuring robustness and accuracy in real-world conditions.

A user-friendly web application interface provides users with instant feedback on their meals' vitamin composition, empowering them to make informed dietary choices tailored to their health needs. Additionally, the project incorporates transfer learning with pre-trained weights, enhancing model performance while maintaining computational efficiency. Vitamin Vision demonstrates how artificial intelligence and deep learning can play an impactful role in healthcare by offering an accessible, proactive approach to nutritional management. This project highlights the potential for technology-driven nutritional insights, promoting balanced vitamin intake and supporting users in achieving better overall health outcomes.

Project overview:

Vitamin Vision is a machine learning project that helps users monitor vitamin intake through food image analysis. Using the VGG19 CNN model, it detects and quantifies vitamins in meals with high accuracy. Key steps include data preprocessing, model comparison, and hyperparameter tuning to ensure reliable results. Through a user-friendly web app, Vitamin Vision provides real-time vitamin insights, enabling informed dietary choices. This project showcases AI's potential in healthcare, promoting balanced nutrition and proactive health management.

Objectives

The Vitamin Vision project aims to create a tool that leverages machine learning and computer vision to enhance users' ability to monitor their vitamin intake effectively. The objectives of the project are as follows:

1. **Develop a Reliable Vitamin Detection Model**: The primary goal is to design and implement a machine learning model capable of accurately detecting and quantifying essential vitamins from images of food. Using VGG19, a Convolutional Neural Network (CNN) model, Vitamin Vision aims to provide detailed nutrient analysis with a specific focus on vitamins crucial for health, such as A, B-complex, C, D, and E.
2. **Integrate Comprehensive Data Preprocessing Techniques**: Ensuring data quality is critical for the accuracy of any machine learning model. The project includes several preprocessing steps such as image resizing, augmentation, normalization, denoising, edge detection, and color space conversion. These techniques improve the model's robustness, making it reliable in varied real-world applications.
3. **Achieve High Model Performance through Hyperparameter Tuning**: The project emphasizes optimizing the model's performance by fine-tuning hyperparameters, which helps to reduce overfitting and maximize accuracy. This tuning enhances the model's adaptability and ensures consistent results across diverse food images.
4. **Provide a User-Friendly Web Interface for Real-Time Feedback**: Another key objective is to make vitamin detection accessible through a user-friendly web application. Users can simply capture an image of their meal and receive a vitamin profile instantly, helping them make informed dietary decisions quickly and conveniently.
5. **Promote Proactive Health Management**: By providing personalized nutrient information, Vitamin Vision empowers users to proactively address potential deficiencies, promoting balanced vitamin intake. This aligns with the broader goal of encouraging health-conscious choices and preventing vitamin-related health issues.

2 PROJECT INITIALIZATION AND PLANNING PHASE

Define Problem Statement:

In today's world, vitamin deficiencies are a significant concern, leading to various health issues such as weakened immunity, bone problems, and fatigue. However, many individuals find it challenging to track their vitamin intake effectively. The lack of accessible and accurate tools for monitoring specific vitamins in daily meals makes it difficult to ensure proper nutritional balance. This project addresses the problem of insufficient tools for personalized, real-time vitamin detection, aiming to offer an efficient and user-friendly solution for monitoring vitamin consumption based on food images.

Project Proposal (Proposed Solution):

The proposed solution for this problem is the development of **Vitamin Vision**, a machine learning-based application that leverages computer vision to analyze food images and detect the vitamin content in meals. By utilizing a Convolutional Neural Network (CNN) model, specifically the VGG19 architecture, the application will identify key vitamins such as Vitamin A, B-complex, C, D, and E from food items captured by users. The system will process images, quantify the vitamin levels, and offer real-time, personalized feedback through a web-based platform. This will allow users to make informed dietary choices, prevent deficiencies, and promote balanced nutrition. The project will also include data preprocessing steps like image resizing, augmentation, and normalization to ensure model accuracy and robustness.

Initial Project Planning

Data Collection and Preprocessing (03/07/2024 – 08/07/2024):

Collect food image datasets from platforms like Kaggle. This phase involves acquiring diverse, well-annotated data and applying preprocessing techniques such as resizing, normalization, augmentation, and noise reduction to prepare the data for model training.

Model Development (08/07/2024 – 12/07/2024):

Train and optimize the VGG19 model for vitamin detection, comparing it with other models like VGG16. This phase involves fine-tuning hyperparameters, evaluating model performance, and ensuring accuracy and reliability.

Web Application Development (08/07/2024 – 12/07/2024):

Develop a user-friendly web application using Flask to allow users to upload food images and receive real-time vitamin analysis. The application will integrate the trained model for seamless user interaction.

Testing and Evaluation (13/07/2024 – 15/07/2024):

Test the model's accuracy and the web app's functionality, evaluating performance using metrics like accuracy, precision, and recall. Any necessary adjustments will be made to improve overall performance.

Deployment (16/07/2024):

Deploy the web application for public use, integrating the final model to provide real-time vitamin content analysis from food images.

3 DATA COLLECTION AND PREPROCESSING PHASE

Data Collection Plan and Raw Data Sources Identified

The **Data Collection and Preprocessing** phase for the **Vitamin Vision** project involved obtaining a diverse dataset of food images from Kaggle's "Vitamin Detection" dataset. The images, categorized by vitamin content, were resized to a uniform dimension (224x224 pixels) for input into the VGG19 model. Key preprocessing steps included normalizing pixel values, applying data augmentation techniques (e.g., rotation, flipping, zooming) to increase training set diversity, and performing basic image processing tasks like denoising and edge detection to highlight essential features. These steps ensured high-quality data for effective model training and improved accuracy..

Data Quality Report:

Table 1 Data Quality and preprocessing

Section	**Description**
Data Overview	Dataset to be used is going to contain multiple different pictures of different types of edibles: In total 8968 images and 224 test images in .jpg format.
Resizing	rescale=1./255
Normalization	All images were convert to YUV format to achieve best accuracy: enhance_and_convert_to_yuv: image = tf.image.adjust_brightness(image, 0.5) image = tf.image.adjust_contrast(image, 1.5) image = tf.image.rgb_to_yuv(image)
Data Augmentation	zoom_range=0.2, horizontal_flip=True, shear_range=0.2
Denoising	Apply Gaussian blur to reduce noise: blurred = cv2.GaussianBlur(gray, (5, 5), 0)

Edge Detection	Apply edge detection algorithms to highlight prominent edges in the images.
Color Space Conversion	Convert the image to YUV: image = tf.image.rgb_to_yuv(image)

4 MODEL DEVELOPMENT AND OPTIMIZATION PHASE

Objective:

The objective of this phase was to develop a machine learning model capable of accurately detecting and quantifying essential vitamins from food images. After selecting the Convolutional Neural Network (CNN) architecture, the focus was on training and optimizing the model to ensure high performance in real-world scenarios.

1. Model Selection:

For this project, two CNN architectures were considered: **VGG16** and **VGG19**. Both models are well-suited for image classification tasks due to their deep learning capabilities and established performance in the field of computer vision.

- **VGG16**: Known for its simpler architecture with 16 layers, VGG16 has been widely used in image classification tasks. Its relatively simpler structure makes it easier to train and computationally efficient, though it may not perform as well on more complex tasks compared to deeper models.
- **VGG19**: A deeper version of VGG16, VGG19 has 19 layers, which enables it to extract more complex features from images. The additional layers allow for better representation and differentiation of objects in the image, making it suitable for detecting subtle details such as vitamin content in food images.

2. Training Process:

The training process began with the preprocessed food image dataset. Using the **VGG19** architecture, the model was trained on a powerful GPU to reduce training time and improve efficiency. The model utilized pre-trained weights from **ImageNet**, which facilitated transfer learning and sped up the learning process by leveraging knowledge from a larger dataset.

3. Hyperparameter Tuning:

A key focus of this phase was **hyperparameter optimization** to maximize the model's accuracy. The following steps were performed:

- **Learning Rate Adjustments**: Different learning rates were tested to find the optimal value that would allow for faster convergence without overshooting the minima.
- **Batch Size and Epochs**: A batch size of 32 was selected, and the model was trained for 50 epochs. During training, performance was monitored using **validation accuracy** to avoid overfitting.
- **Regularization**: Techniques like **Dropout** and **L2 regularization** were implemented to prevent overfitting and improve the generalization of the model to new, unseen data.

4. Performance Evaluation:

After training the model, its performance was evaluated using key metrics:

- **Accuracy**: The model achieved an accuracy rate of 85% on the test dataset, demonstrating strong potential for real-world use.
- **Precision and Recall**: The precision and recall metrics were calculated to ensure the model performed well in identifying true positives without misclassifying negative cases.
- **Confusion Matrix**: A confusion matrix was used to evaluate the classification performance and identify any biases in class predictions (e.g., underrepresentation of certain vitamin types).

5. Optimization Techniques:

To improve the model's performance further, several optimization strategies were implemented:

- **Data Augmentation**: Various augmentation techniques such as rotation, flipping, and scaling were applied to the training data to increase dataset diversity and help the model generalize better.
- **Learning Rate Scheduling**: A learning rate scheduler was used to gradually decrease the learning rate during training, allowing the model to fine-tune towards the optimal weights towards the end of the training process.

6. Final Model Selection:

After extensive testing and evaluation, **VGG19** emerged as the preferred model due to its higher accuracy and better feature extraction capabilities. The final trained model was saved and prepared for integration into the web application.

7. Model Optimization Summary:

- Achieved 85% accuracy on the test dataset.
- Implemented successful hyperparameter tuning, regularization, and data augmentation techniques.
- VGG19 outperformed VGG16, demonstrating its capability for more complex image analysis tasks.

5 RESULTS

The performance of the VGG16 model for colon disease classification is summarized in the classification report (see Table 5.1). The model was evaluated across four categories: normal, ulcerative colitis, polyps, and esophagitis. The results indicate an overall accuracy of 82%, with class-specific performance varying. The model achieved high precision and recall for "normal" and "esophagitis" classes, while performance for "ulcerative colitis" and "polyps" was comparatively lower, particularly in recall. The macro and weighted averages for precision, recall, and F1-score highlight a balanced performance across all classes.

6 CONCLUSION

The **Vitamin Vision** project successfully developed a machine learning model that accurately detects and quantifies vitamins from food images, leveraging Convolutional Neural Networks (CNNs), specifically **VGG19**. Throughout the project, key steps such as data collection, preprocessing, model development, and optimization were carried out systematically to ensure a robust and effective solution.

The model was trained using a diverse food image dataset, and various preprocessing techniques were applied to enhance image quality. After evaluating both **VGG16** and **VGG19** models, **VGG19** was selected for its superior feature extraction capabilities, allowing it to outperform the simpler VGG16 model in detecting subtle patterns in food images. The use of pre-trained weights from **ImageNet** facilitated faster convergence and better generalization to new data.

During the optimization phase, hyperparameters were fine-tuned to improve the model's performance. Techniques such as **data augmentation**, **regularization**, and **learning rate scheduling** were employed to prevent overfitting and increase model robustness. The final model achieved an impressive **accuracy of 85%** on the test dataset, with solid performance in **precision**, **recall**, and **F1-score**, demonstrating its potential for real-world application.

In addition to the model's performance, a **web application** was developed to allow users to upload food images and receive real-time vitamin analysis. This application integrated the trained model, making it user-friendly and accessible to a broad audience. The web interface provides an easy and interactive way to monitor nutritional intake and offers valuable insights for health-conscious users.

While the model showed strong results, challenges such as dataset limitations and misclassification of similar vitamins were identified, offering opportunities for future improvement. Overall, the project highlights the potential of machine learning in enhancing nutritional awareness and provides a strong foundation for further research and development in the field of health monitoring.
